

#### 5.33.4 Setting the Global Default Class Name

In addition to referencing a CSS class in a widget, you can also set a global default class name for all the related widgets in this analytic application without having to specify the class name for each widget.

For instance, the *Global Default Class Name* is set to `my-theme`, which includes the CSS settings for all Chart and Table widgets, so that you don't need to specify a CSS class for each specific Chart or Table widget.
